ROLLER BURNISHING

THE PRINCIPLE OF ROLLER BURNISHING

Roller burnishing is a cold-working process which produces a fine surface finish by the planetary rotation of hardened rolls over a bored or turned metal surface. However, unlike cold rolling, which generally produces large sectional changes, roller burnishing involves cold-working on the surface of the workpiece to improve surface structure. In the burnishing process, the pressure generated by the rolls exceeds the yield point of the softer piece part surface at the point of contact.

The result is a small plastic deformation of the surface structure of the piece part. Since all machined surfaces consist of a series of peaks and valleys of irregular height and spacing, the plastic deformation created by roller burnishing is a displacement of the material in the peaks which cold flows under pressure into the valleys. In the process, tool marks and irregularities are rolled out. The result is a mirror like finish with a tough, work-hardened, wear and corrosion resistant surface.

BENEFITS OF ROLLER BURNISHING

Improved metallurgical properties

Burnishing cold works the metal of a machined part. Tool marks are rolled out. Grain structure is condensed and refined, and the compacted surface is smoother, harder and longer wearing than ground or honed surfaces. The rolling action also greatly reduces surface porosity and scratches which could hold reactive substances or contaminants. As a result, the corrosion resistance of burnished surfaces is higher than the open surfaces produced by grinding or honing. Depending on the type of material being burnished, surface hardness can be increased by as much as 10 points Rockwell C. This increase often eliminates the need for heat treatment as a means of improving wear resistance. Another metallurgical improvement stems from induced residual compressive stresses in the surface of the part as a result of plastic deformation in the roller burnishing operation. These compressive stresses greatly increase the strength properties and fatigue life of the part, because any forces on the part must overcome these residual stresses, as well as the tensile strength of the materials, before fatigue conditions occur.

Improved surface finish

Roller burnishing imparts a high finish to any machinable metal. Surfaces which are bored, reamed or turned to 125 micro inches or more can be finished to 4 micro inch CLA or less in one pass at feed rates of 125 to 300 mm/min.

Roller burnishing replaces grinding, honing, lapping and other expensive secondary operations.

IL PRINCIPIO DELLA RULLATURA

La rullatura è un procedimento di lavorazione a freddo, senza asportazione di truciolo, che consente di ottenere una superfinitura superficiale. I rullini conici, forzati contro la superficie da rullare, generano una pressione che produce una deformazione plastica del materiale. Qualunque superficie lavorata con utensile ad asportazione di truciolo, vista in sezione con il dovuto ingrandimento, si presenta come una successione irregolare di creste, che danno luogo alla rugosità superficiale. La deformazione plastica prodotta dalla pressione dei rullini, consiste in un appiattimento delle creste con un movimento del materiale che va ad occupare il vuoto esistente tra due creste successive. In tal modo si ottiene una superficie lucida a "specchio" che presenta un aumento di durezza e densità.

VANTAGGI DELLA RULLATURA

Variazioni di struttura

La rullatura provoca una compressione plastica della superficie lavorata, che, oltre ad eliminare la rugosità della superficie, causa una variazione di struttura cambiando la forma e l'orientamento dei grani. Si ha una superficie lucida, compatta, indurita; ne deriva una maggior resistenza all'usura ed alla corrosione. L'aumento di durezza dipende dalle caratteristiche del materiale lavorato e dalla quantità di soprametallo rullato; comunque, con la rullatura, si possono ottenere aumenti della durezza superficiale pari ad una variazione di 10 punti HRC. Le superfici rullate resistono pertanto decisamente meglio, rispetto alle superfici rettifiche, agli sforzi di rottura.

Finitura superficiale

Il rullatore consente di ottenere una finitura superficiale speculare, su qualunque materiale lavorabile d'utensile. Una superficie lavorata d'utensile, con una rugosità pari a 125 micropollici, viene finita con una rugosità di Ra 4 micropollici, con una sola passata; l'avanzamento varia da un minimo di 125 mm al minuto, ad un massimo di 300 mm.

L'impiego del rullatore elimina la necessità di altre operazioni di finitura, ben più costose.

CODE DESCRIPTION OF THE INCREASED CONES

FOR ROLLER BURNISHING TOOLS BLIND HOLES

Method for the identification of number "x" contained in the code of the blind holes cones.

With blind hole burnishing, the cone must not extend past the end of the rolls, otherwise it risks the collision with the bottom of the hole. Each burnishing tool has an adjustment range of approximately 0,5 mm on diameter for tools below 12,7 mm and about 1 mm. for tools above 12,7 mm diameter.

For through hole burnishing tools, the standard cone value "x" is 1. If the standard cone is used for blind hole burnishing it will not extend past the end of the rolls only when the tool is set to the minimum value of the adjustment range. However, if the blind hole to be burnished is greater than the minimum diameter of the tool, then an increased diameter cone is required. With these applications the "x" value (always an integer number) will vary from 2 to 8.

CASE A - RULE FOR THE IDENTIFICATION OF THE INCREASED CONE (burnishing tools from Ø 5,89 to 12,77)

$$"x" = 1 + \frac{Z-Y}{0,05}$$

Z= diameter of the hole to be burnished

Y= minimum diameter setting of the burnishing tool in question (see tables on following pages).

As a consequence of the above mentioned calculation, the "x" value could culminate as a decimal figure. This must be approximated to an integer value below or above if decimal figure is greater than 0,8 mm.

Example: Identification of the increased cone for a burnishing tool blind hole, short series

Z = diameter to be burnished 11,05 mm Y = minimum diameter setting 10,71 mm

$$"x" = 1 + \frac{11,05-10,71}{0,05} = 7,8 \text{ which is approximated at } "x" = 8$$

The correct cone is: **RSTH-038-10025**

CASE B - RULE FOR THE IDENTIFICATION OF THE INCREASED CONE (burnishing tools from Ø 12,64 to 127,94)

$$"x" = 1 + \frac{Z-Y}{0,1}$$

Example: Z = diameter to be burnished 17,76 mm Y = minimum diameter setting 17,40 mm

$$"x" = 1 + \frac{17,76-17,40}{0,1} = 4,6 \text{ which is approximated at } "x" = 4$$

The correct cone is: **RSTK-034-00044**

CASE C - RULE FOR THE IDENTIFICATION OF THE INCREASED CONE (burnishing tools from Ø 127,90 to 165,90)

$$"xx" = 31 + \frac{Z-Y}{0,1}$$

Example: Z = diameter to be burnished 148,2 mm Y = minimum diameter setting 147,9 mm

$$"xx" = 31 + \frac{148,2-147,9}{0,1} = 34$$

The correct cone is: **RSTT-034-01480**

IDENTIFICAZIONE CODICE DELLE ASTE MAGGIORATE

S.C.A.M.I.®

PER RULLATORI PER FORI CIECHI

Metodo per l'identificazione del numero "x" contenuto nel codice di ogni asta per fori ciechi.

Nei rullatori per fori ciechi, l'asta conica non deve sporgere oltre i rulli altrimenti si rischia la collisione al fondo del foro. Pertanto, per ogni rullatore per foro cieco va individuata l'asta corretta che non sporga.

Ogni rullatore ha un campo di regolazione di circa 0,5 mm sul diametro per i rullatori di diametro inferiore a 12,7 mm e di circa 1 mm sul diametro per i rullatori al di sopra del diametro 12,7 mm. L'asta per la quale il valore "x" è uguale a 1 è quella normalmente utilizzata per i rullatori per fori passanti e, qualora venga utilizzata nel corrispondente rullatore per fori ciechi, non sporge rispetto ai rulli solamente se il rullatore è regolato al valore minimo del suo campo di regolazione.

Qualora occorra rullare un foro cieco il cui diametro si colloca su un valore intermedio del campo di regolazione, bisogna allora necessariamente ricorrere ad un'asta maggiorata, per la quale il valore "x" (numero intero) varia tra i valori 2 e 8.

CASO A - CALCOLO PER L'IDENTIFICAZIONE DELL'ASTA MAGGIORATA (rullatori dal Ø 5,89 a 12,77)

$$"x" = 1 + \frac{Z-Y}{0,05}$$

Z = diametro del foro effettivamente da rullare

Y = diametro minimo del campo di regolazione del rullatore in oggetto (vedi tabelle nelle pagine seguenti).

Dal calcolo di cui sopra "x" sarà un valore con decimali dopo la virgola. Occorre approssimarlo al valore intero inferiore a meno che il decimale sia uguale o superiore 0,8, nel cui caso va approssimato al numero intero superiore.

Esempio: Identificazione dell'asta maggiorata per rullatore per fori ciechi, serie corta

Z = diametro da rullare 11,05 mm Y = diametro minimo del campo di regolazione 10,71 mm

$$"x" = 1 + \frac{11,05-10,71}{0,05} = 7,8 \text{ quindi approssimando: } "x" = 8$$

L'asta corretta da ordinare sarà pertanto: **RSTH-038-10025**

CASO B - CALCOLO PER L'IDENTIFICAZIONE DELL'ASTA MAGGIORATA (rullatori dal Ø 12,64 a 127,94)

$$"x" = 1 + \frac{Z-Y}{0,1}$$

Esempio: Z = diametro da rullare 17,76 mm Y = diametro minimo del campo di regolazione 17,40 mm

$$"x" = 1 + \frac{17,76-17,40}{0,1} = 4,6 \text{ quindi approssimando: } "x" = 4$$

L'asta corretta da ordinare sarà pertanto: **RSTK-034-00044**

CASO C - CALCOLO PER L'IDENTIFICAZIONE DELL'ASTA MAGGIORATA (rullatori dal Ø 127,90 a 165,90)

$$"xx" = 31 + \frac{Z-Y}{0,1}$$

Esempio: Z = diametro da rullare 148,2 mm Y = diametro minimo del campo di regolazione 147,9 mm

$$"xx" = 31 + \frac{148,2-147,9}{0,1} = 34 \text{ quindi } "x" = 34$$

L'asta corretta da ordinare sarà pertanto: **RSTT-034-01480**

xxxxxx = Indicate to 2 metric decimal places the size to be burnished.
e.g. Roller burnishing tool
Ø 100 mm with straight shank:
RSKR-100-10000

Numerazione che indica il diametro da rullare in centesimi
es. Rullatore Ø 100 attacco cilindrico: RSKR-100-10000

Each roller burnishing tool is composed by the items / Ogni rullatore è composto dagli elementi **A** + **B** + **C** + **D**

A = basic assembly (which includes MT or straight shank) / corpo base (comprensivo di attacco CM. o cilindrico),

B = cage / gabbia, **C** = cone / asta, **D** = set of rolls / serie di rulli

PREPARATION FOR ROLLER BURNISHING

PREPARAZIONE ALLA RULLATURA

S.C.A.M.I.®

Fig. 3

Fig. 4

Fig. 5

PREPARATION FOR ROLLER BURNISHING

Roller burnishing is a cold working process for obtaining fine finishings.

We remind you some helpful considerations in order to obtain an excellent result:

- **FINISHING:** the ductility and hardness of the workpiece material and the surface preparation dictates the quality of the burnished finish.
- **WORKABILITY:** any ductile and malleable material up to RC40 can be roller burnished.
- **WORKED SURFACE PROPERTIES:** workpieces with an interrupted surface of no more than 10% of the circumference can be successfully burnished with a standard tool. (see fig.1 & 2).
- **TOLERANCE OF THE BURNISHED PIECE:** the tolerance range achieved from the burnishing will be equal to that achieved from the pre machining as no material will be removed.

The ideal surface for the burnishing is a succession of peaks, which corresponds on regular feed of the preparation tool (fig. 3)

We suggest the ALVAN® expanding reamer for the pre-burnishing as it assures an uniform roughness and a tolerance in the range ISO6 - ISO7.

Attention must be paid to pre machining tapers and surface irregularities caused by cutting tool failure as these conditions cannot be rectified by the roller burnishing operation (see fig.4 & 5).

PREPARAZIONE ALLA RULLATURA

La rullatura è un procedimento di lavorazione per ottenere delle superfiniture.

Rammentiamo alcune considerazioni utili al fine di un ottimo risultato:

- **FINITURA:** la finitura superficiale è funzione della durezza e duttilità del pezzo e della rugosità che si ottiene nella preparazione alla rullatura.
- **LAVORABILITÀ DEL PEZZO:** si può dire che ogni materiale lavorabile all'utensile può essere rullato. In linea generale è meglio che la durezza del pezzo non superi i 40 HRC.
- **CARATTERISTICHE DELLA SUPERFICIE LAVORATA:** è sempre meglio che la superficie lavorata non presenti discontinuità. Ad ogni modo è importante che la larghezza di una eventuale interruzione non superi il 10% del diametro del pezzo rullato. Numero minimo di rullini = 5
- **TOLLERANZA DEL PEZZO RULLATO:** la tolleranza che si vuole ottenere dopo la rullatura, occorre che sia già rispettata nella preparazione.

La superficie ideale per la rullatura è quella che si ottiene come successione di creste, corrispondenti ad un avanzamento regolare dell'utensile preparatore (fig. 3).

Come utensile di pre-rullatura, suggeriamo l'alesatore ALVAN®, in quanto assicura una rugosità uniforme ed una tolleranza nel campo ISO6 - ISO7.

Nella preparazione alla rullatura occorre prestare attenzione ad eventuali errori di conicità e ad errori dovuti a scheggiature dello spigolo tagliente. Infatti il rullatore non è in grado di rimediare ad errori di conicità né a solchi troppo evidenti già in fase di preparazione (vedi fig. 4 e 5). Lo spessore minimo della cartella rullabile è pari al 10% del diametro da rullare.

ADJUSTMENT & HOW THE ROLLER BURNISHING TOOL WORKS REGISTRAZIONE E FUNZIONAMENTO DEL RULLATORE

Adjustment range Campo di regolazione mm. min. max	Dimension / Quota "G"		
	Through holes Fori passanti		Blind holes Fori ciechi
	Rolls / Rullini 701	704 707	Rolls / Rullini 708
3,95 - 4,75	-	2,4	-
4,70 - 5,88	-	2,4	-
5,89 - 9,47	-	2,4	0,6
9,48 - 15,84	-	2,4	0,6
15,85 - 28,54	5,4	3,2	1,0
28,55 - 46,70	9,5	3,2	1,0
46,71 - 84,80	9,5	4,0	1,0
84,81 - 165,90	10,3	4,7	1,0

Adjustment

The roller burnishing tool incorporates a shank, a body and a planetary system of conical rolls which are evenly spaced by a retaining cage.

Before use, the burnishing tool must be adjusted to the required working diameter using the following steps:

- 1) unscrew the lock nut (item 1);
- 2) pull the housing (item 2) towards the lock nut and turn to increase or decrease the diameter;
- 3) ensure that the micrometer nut and sleeve (item 4 and 5) are engaged.
- 4) tighten the lock nut.

How it works

The roller burnishing tool must be aligned with the workpiece (maximum error 0,1); if there are doubts on the alignment error, a floating shank is needed.

When the tool is in the bore, the cone pushes the rolls onto the surface to be burnished. The cage retains the rolls in an angled position to the axis of the tool, so the pressure of the burnishing generates a self feed that draws the tool into the bore. When self feed is not required, i.e. blind hole applications, you must use a cage which holds the rolls parallel with the axis of the tool. If the machine feed is stopped or slower than the natural rate, the rolls pull the cage, held in position by the release spring (item 3), and they then release from the surface of the bore. The release of the rolls permits the quick retraction from the bore (see table dimension "G").

The release spring will ensure the rolls are in the correct position to burnish the required diameter.

The roller burnishing tool requires lubrication not cooling. A plentiful supply of lubricant must be fed directly to tool to provide a good flushing and cleaning action. It is recommended that a filter is fitted to the lubrication system to prevent the circulation of chips which may cause damage to the burnished surface and the tool.

Registrazione

Il rullatore è costituito da un attacco, un corpo ed un sistema planetario di rullini conici, tenuti in posizione da una gabbia. L'impiego del rullatore deve essere preceduto dalla regolazione alla misura di lavoro; tale operazione si esegue:

- 1) svitare la ghiera di bloccaggio (part.1);
- 2) tirare la boccola di registrazione (part.2) verso la ghiera di bloccaggio e ruotarla a seconda se si vuole aumentare o diminuire il diametro;
- 3) rilasciare la boccola di registrazione facendo attenzione che gli innesti (part.4 e 5) siano agganciati;
- 4) avvitare la ghiera di bloccaggio.

Funzionamento

L'utensile deve essere allineato col pezzo (errore massimo 0,1); quando esistono dubbi sull'errore di allineamento, si deve utilizzare un attacco flottante.

Quando l'utensile entra in presa sul pezzo, l'asta conica forza i rullini contro la superficie da rullare. I rullini conici sono tenuti dalla gabbia in una posizione inclinata rispetto all'asse dell'utensile e pertanto la pressione di rullatura genera una componente assiale che tira l'utensile nel pezzo e viceversa. Quando si richiede la rullatura di fori ciechi, si ricorre alla gabbia che tiene i rullini diritti. Se il rullatore non penetra nel pezzo con l'avanzamento richiesto da tale componente, i rullini trascinano in avanti la gabbia che è tenuta in posizione dalla molla (part.3) e si sganciano dalla superficie lavorata, con conseguente discontinuità di finitura e di misura. Peraltro, la possibilità di sganciare i rullini dalla superficie lavorata consente l'estrazione rapida del pezzo (vedi tabella quota "G"). Provvederà la molla a riportare i rulli in posizione di lavoro, alla misura fissata.

Il rullatore necessita di lubrificazione. Qualsiasi olio lubrificante o miscela di olio solubile è utilizzabile. Il lubrificante deve arrivare sull'utensile con continuità ed abbondanza. È indispensabile l'impiego di un filtro per impedire che i trucioli siano trascinati in circolo, con conseguente danno all'utensile ed alla superficie del pezzo rullato.

TECHNICAL INFORMATION

100	2,30	150
120	2,70	
140	3,20	
165	3,90	

High ductility materials

They have less than 30 RC and more 18% elongation
E.g. stainless steel, annealed steel, aluminium, brass, bronze and malleable iron

Low ductility materials

Have less than 40 RC and less than 18% elongation
E.g.: nodular iron, grey cast iron, heat treated steel, magnesium alloys and hard copper alloys.

Materiali molto duttili

Durezza inferiore a 30 HRC, con allungamento percentuale dopo rottura superiore al 18%
Es.: acciai a basso tenore di carbonio, acciai da costruzione ricotti, acciai inox, alluminio, ottone, ghisa malleabile, rame.

Materiali poco duttili

Durezza inferiore a 40 HRC, con allungamento percentuale dopo rottura inferiore al 18%
Es.: ghisa grigia, acciai bonificati, leghe al magnesio.

RPM can be increased or decrease according to the material to work.

The chart is for guide purposes only; in different conditions the results may vary.
Excessive roller burnishing accelerates tool wear and can produce flaking on the burnished surface.

Il numero dei giri / min può essere aumentato o diminuito in funzione del tipo di materiale lavorato.
Mantenersi sui valori della tabella; valori eccessivi della velocità o dell'avanzamento riducono la durata dell'utensile.

EXAMPLE OF SPECIAL ROLLER BURNISHING TOOLS ESEMPI DI RULLATORI SPECIALI

Roller burnishing tools which require special working lengths or shanks can be supplied on request.

SCAMI have proven designs of Roller Burnishing equipment to suit most applications. The following pages show but a few innovations incorporating many standard sub assemblies. Moreover, depending on the application there are different kinds of burnishing tools.

Su richiesta tutti i rullatori possono essere forniti con diverse lunghezze di rullatura e di attacchi speciali.

Inoltre a seconda dell'applicazione esistono diversi tipi di rullatori.

Internal conical burnishing tool

Rullatore conico per interni

Internal conical burnishing tool

Diamond roller burnishing tool

Single-roller with diamond tip for super finishing materials with hardness up to 65 HRC

- The tool is available to realise surface roughness in the Ra range between 0,05 and 0,15 micron.
- Diamond with radius: 0,8 - 1,2 - 2,0
- Working angle adjustable in 15° steps

CODE DESCRIPTION OF THE REDUCED CONES

S.C.A.M.I.®

FOR ROLLER BURNISHING TOOLS BOTTOMING STYLE

Method for the identification of number "x" contained in the code of the bottoming style cones.

With burnishing tools for bottoming style the cone must not extend past the end of the rolls, otherwise it risks the collision. Each burnishing tool has an adjustment range of approximately 0,4 mm on diameter for tools below Ø 11,95 and 0,8 mm for tools above Ø 11,95 mm.

For through burnishing tools style the standard cone value "x" is 1. If the standard cone is used for bottoming style it will not extend past the end of the rolls only when the tool is set to the maximum value of the adjustment range. However, if an external diameter bottoming style to be burnished is greater than the maximum diameter of the tool, then a reduced diameter cone is required.

With these applications the "x" be (always an integer number) in the range from 2 to 8.

CASE A - RULE FOR THE IDENTIFICATION OF THE REDUCED CONE (burnishing tools from Ø 2,74 to 11,95)

$$"x" = 1 + \frac{Z - Y}{0,05}$$

Z = diameter to be burnished

Y = maximum diameter setting of the burnishing tool in question (see tables on following pages).

As a consequence of the above mentioned calculation, the "x" value could culminate as a decimal figure. This must be approximated to an integer value below or above if decimal figure is greater than 0,8 mm.

Example:

Z = diameter to be burnished 6,5 mm. Y = maximum diameter setting 6,8 mm.

$$"x" = 1 + \frac{6,8 - 6,5}{0,05} = 7$$

The correct cone is: **RBTA - 037 - 00017**

CASE B - RULE FOR THE IDENTIFICATION OF THE REDUCED CONE (burnishing tools from Ø 11,96 to 95,35)

Example :

Z = diameter to be burnished 17,76 mm. Y = maximum diameter setting 18,33 mm

$$"x" = 1 + \frac{18,33 - 17,76}{0,1} = 6,7 \quad \text{which is approximated at } "x" = 6$$

The correct cone is: **RBTB - 036 - 00039**

IDENTIFICAZIONE CODICE DELLE ASTE RIDOTTE

RULLATORI PER ESECUZIONE CON BATTUTA

Metodo per l'identificazione del numero "x" contenuto nel codice di ogni asta per esecuzione con battuta.

Nei rullatori per esterni con battuta l'asta conica non deve sporgere oltre i rulli altrimenti si rischia la collisione pertanto, va individuata l'asta corretta che non sporga. Ogni rullatore ha un campo di regolazione di circa 0,4 mm su diametri inferiori a 11,95 mm e di circa 0,8 mm per quelli superiori. L'asta per la quale il valore "x" è uguale a 1 è quella normalmente utilizzata per i rullatori per fori passanti e, qualora venga utilizzata nel corrispondente rullatore con battuta, non sporge rispetto ai rulli solamente se il rullatore è regolato al valore massimo del suo campo di regolazione. Qualora occorra rullare un diametro esterno con battuta che si colloca su un valore intermedio del campo di regolazione, bisogna necessariamente ricorrere ad un'asta ridotta, per la quale il valore "x" (numero intero) varia tra i valori 2 e 8.

CASO A - CALCOLO PER L'IDENTIFICAZIONE DELL'ASTA RIDOTTA (rullatori dal Ø 2,74 a 11,95)

$$"x" = 1 + \frac{Z - Y}{0,05}$$

Z = diametro da rullare

Y = diametro massimo del campo di regolazione del rullatore in oggetto (vedi tabelle nelle pagine seguenti).

Dal calcolo di cui sopra "x" sarà un valore con decimali dopo la virgola. Occorre approssimarlo al valore intero inferiore a meno che il decimale sia uguale o superiore 0,8, nel cui caso va approssimato al numero intero superiore.

Esempio: Z = diametro da rullare 6,5 mm. Y = diametro massimo della gamma 6,8 mm.

$$"x" = 1 + \frac{6,8 - 6,5}{0,05} = 7$$

L'asta corretta da ordinare sarà pertanto: **RBTA - 037 - 00017**

CASO B - CALCOLO PER L'IDENTIFICAZIONE DELL'ASTA RIDOTTA (rullatori dal Ø 11,96 a 95,35)

Esempio: Z = diametro da rullare 17,76 mm. Y = diametro massimo della gamma 18,33 mm.

$$"x" = 1 + \frac{18,33 - 17,76}{0,1} = 6,7 \text{ approssimando } "x" = 6$$

L'asta corretta da ordinare sarà pertanto: **RBTB - 036 - 00039**

xxxxx = Indicate to 2 metric decimal places the size to be burnished.

e.g. Roller burnishing tools for bottoming style Ø 34,23 mm with M.T. shank: RBKB-200-03423

Numerazione che indica il diametro da rullare in centesimi

es. Rullatore Ø 34,23 attacco C.M.: RBKB-200-03423

xxxxx = Indicate to 2 metric decimal places the size to be burnished.
 e.g. Roller burnishing tools for bottoming style Ø 60,30 mm with M.T. shank: RBKC-200-06030

Numerazione che indica il diametro da rullare in centesimi
 es. Rullatore Ø 60,30 attacco C.M.: RBKC-200-06030

xxxxx = Indicate to 2 metric decimal places the size to be burnished.

e.g. Roller burnishing tools for bottoming style Ø 90,10 mm with M.T. shank: RBKD-200-09010

Numerazione che indica il diametro da rullare in centesimi

es. Rullatore Ø 90,10 attacco C.M. : RBKD-200-09010

From diam. 66,78 to 95,35 mm.

Da diam. 66,78 a 95,35 mm.

ADJUSTMENT & HOW THE ROLLER BURNISHING TOOL WORKS

REGISTRAZIONE E FUNZIONAMENTO RULLATORE

Adjustment range Campo di regolazione Ø D min. max.	Dimension / Quota "G"	
	Through Passante	Bottoming style Con Battuta
	Rolls / Rullini 704 - 707 min. max.	Rolls / Rullini 705 - 705
2,86 - 11,95	2,40 - 8,5	0,60
11,96 - 95,35	4,00 - 14,5	1,00

Adjustment

The roller burnishing tool incorporates a shank, a body and a planetary system of conical rolls which are evenly spaced by a retaining cage. Before use, the burnishing tool must be adjusted to the required working diameter using the following steps:

- 1) unscrew the lock screw (item 1);
- 2) turn the adjustment housing for increase or decrease the diameter;
- 3) tighten the lock screw.

Registrazione

Il rullatore è costituito da un attacco, un corpo ed un sistema planetario di rullini conici tenuti in posizione da una gabbia.

L'impiego del rullatore deve essere preceduto dalla regolazione alla misura di lavoro; tale operazione si esegue:

- 1) svitare il grano di bloccaggio (part. 1);
- 2) ruotare la boccola di registrazione a seconda se si vuole aumentare o diminuire il diametro;
- 3) avvitare il grano di bloccaggio.

How it works

The roller burnishing tool must be aligned with the workpiece (maximum error 0,1); if there are doubts on the alignment error, a floating shank is needed. When the tool is in the bore, the cone pushes the rolls onto the surface to be burnished. The cage retains the rolls in an angled position to the axis of the tool, so the pressure of the burnishing generates a self feed that draws the tool into the bore. When self feed is not required, i.e. bottoming style, you must use a cage which holds the rolls parallel with the axis of the tool. If the burnishing tool is not used with correct self feed, the rolls pull the cage, held in position by the release spring, and they then release from the surface. The release of the rolls permits the quick retraction (see table dimension "G").

The release spring will ensure the rolls are in the correct position to burnishing the required diameter. The roller burnishing tool requires lubrication not cooling. A plentiful supply of lubricant must be fed directly to tool to provide a good flushing and cleaning action. It is recommended that a filter is fitted to the lubrication system to prevent the circulation of chips which may cause damage to the burnished surface and the tool.

Funzionamento

L'utensile deve essere allineato con il pezzo (errore massimo 0,1); quando esistono dubbi sull'errore di allineamento, si deve utilizzare un attacco flottante. Quando l'utensile entra in presa sul pezzo, l'asta conica forza i rullini contro la superficie da rullare. I rullini conici sono tenuti dalla gabbia in una posizione inclinata rispetto all'asse dell'utensile pertanto, la pressione di rullatura genera una componente assiale che tira l'utensile nel pezzo e viceversa. Quando si richiede la rullatura con battuta, si ricorre alla gabbia che tiene i rullini diritti. Se il rullatore non viene utilizzato con l'avanzamento richiesto da tale componente, i rullini trascinano in avanti la gabbia che è tenuta in posizione dalla molla e si sganciano dalla superficie lavorata con conseguente discontinuità di finitura e di misura. Peraltro, la possibilità di sganciare i rullini dalla superficie lavorata consente l'estrazione rapida del pezzo (vedi tabella quota "G"). Provvederà la molla a riportare i rulli in posizione di lavoro alla misura fissata. Il rullatore necessita di lubrificazione. Qualsiasi olio lubrificante o miscela di olio solubile è utilizzabile. Il lubrificante deve arrivare sull'utensile con continuità ed abbondanza. E' indispensabile l'impiego di un filtro per impedire che i trucioli siano trascinati in circolo, con conseguente danno all'utensile ed alla superficie del pezzo rullato.

TECHNICAL INFORMATION

INDICAZIONI TECNICHE

Material to work Materiale da lavorare	Diameter Diametro mm	Stock allowance on Ø Sovrametallo sul Ø	Surface finish (Ra) / Rugosità (Ra)	
			Before roller burnishing Prima della rullatura	After roller burnishing Dopo la rullatura

95	2,50	

High ductility materials

Have less than 30 RC and more than 18% elongation
E.g.: stainless steel, annealed steel, aluminium brass, bronze and malleable iron.

Low ductility materials

Have less than 40 RC and less than 18% elongation
E.g.: nodular iron, grey cast iron, heat treated steel, magnesium alloys and hard copper alloys.

Materiali molto duttili

Durezza inferiore a 30 HRC, con allungamento percentuale dopo rottura superiore al 18%
Es.: acciai a basso tenore di carbonio, acciai da costruzione ricotti, acciai inox, alluminio, ottone, ghisa malleabile, rame.

Materiali poco duttili

Durezza inferiore a 40 HRC, con allungamento percentuale dopo rottura inferiore al 18%
Es.: ghisa grigia, acciai bonificati, leghe al magnesio.

RPM can be increased or decreased according to the material to work.

The chart is for guide purposes only; in different conditions the results may vary.

Excessive roller burnishing accelerates tool wear and can produce flaking on the burnished surface.

Il numero dei giri/min pu essere aumentato o diminuito in funzione del tipo di materiale lavorato.

Mantenersi sui valori della tabella; valori eccessivi della velocit o dell'avanzamento riducono la durata dell'utensile.

INSTRUCTIONS FOR ASSEMBLY AND DISASSEMBLY

External roller burnishing tools for cylindrical surfaces bottoming style and through style (from Ø 2,74 to Ø 11,95)

Rolls disassembly

- 1 - Turn the adjustment housing for bringing forward the cage
- 2 - Pull the cage forward manually or with a screwdriver
- 3 - Remove the rolls

Assembly

Reassembly the components in the inverted order of disassembly.
Grease the rolls before their assembly.

Cone disassembly

- 1 - Disassembly the rolls as already instructed above
- 2 - Unscrew the lock nut
- 3 - Extract the cone

Assembly

Reassembly the components in the inverted order of disassembly.

Cage disassembly

- 1 - Disassembly the rolls and the cone
- 2 - Unscrew the lock nut
- 3 - Extract the cage

Assembly

Reassembly the components in the inverted order of disassembly.

ISTRUZIONI PER IL MONTAGGIO E LO SMONTAGGIO

Rullatori per esterni per superfici cilindriche con battuta e passanti (dal Ø 2,74 al Ø 11,95)

Smontaggio dei rullini

- 1 - Girare la boccola di registrazione per portare il più avanti possibile la gabbia
- 2 - Tirare la gabbia in avanti, a mano o con l'aiuto di un cacciavite
- 3 - Togliere i rullini

Montaggio

Montare i pezzi dell'utensile nell'ordine inverso dalle operazioni di smontaggio.
Prima di montare i rullini ricoprirli con del grasso.

Smontaggio dell'asta

- 1 - Smontare i rullini come indicato
- 2 - Svitare la ghiera di bloccaggio
- 3 - Sfilare l'asta

Montaggio

Montare i pezzi nell'ordine inverso dalle operazioni di smontaggio.

Smontaggio della gabbia

- 1 - Smontare i rullini e l'asta come indicato
- 2 - Svitare la ghiera di bloccaggio all'interno dell'utensile
- 3 - Sfilare la gabbia

Montaggio

Montare i pezzi nell'ordine inverso dalle operazioni di smontaggio.

INSTRUCTIONS FOR ASSEMBLY AND DISASSEMBLY

External roller burnishing tools for cylindrical surfaces bottoming style and through style (from Ø 11,96 to Ø 95,35)

Cage and rolls disassembly

- 1 - Turn forward the adjustment housing towards the cage till the holes without screws of the cone are aligned with the screws of the cage sleeve. For the series "B" the holes coincide to ones for locking the cone.
- 2 - Unscrew the cage sleeve screws
- 3 - Disassembly the cage
- 4 - Remove the rolls

Assembly

Reassembly the components in the inverted order of disassembly. Grease the rolls before their assembly.

Cone disassembly

- 1 - Disassembly the cage and the rolls as already instructed above
- 2 - Extract the cage

Assembly

Reassembly the components in the inverted order of disassembly.

ISTRUZIONI PER IL MONTAGGIO E LO SMONTAGGIO

Rullatori per esterni per superfici cilindriche con battuta e passanti (dal Ø 11,96 al Ø 95,35)

Smontaggio della gabbia e dei rullini

- Girare la boccola di registrazione in avanti verso la gabbia fino a che i fori senza viti dell'asta siano in linea con le viti del guidagabbia. Nel tipo B i fori corrispondono a quelli di bloccaggio dell'asta. Se i fori non si trovano in linea con le viti, girare la gabbia per portarli in linea.

2 - Svitare le viti sul guidagabbia

3 - Smontare la gabbia

4 - Togliere i rullini

Montaggio

Montare i pezzi dell'utensile nell'ordine inverso dalle operazioni di smontaggio.

Prima di montare i rullini ricoprirli con del grasso.

Smontaggio dell'asta

1 - Smontare la gabbia ed i rullini come indicato

2 - Sfilare l'asta

Montaggio

Montare i pezzi dell'utensile nell'ordine inverso dalle operazioni di smontaggio.
